Mathematical Methods of Physics:

Paper: PH 0701C (Theory)
Credit = 4  Full Marks = 100  Credit = 4
(Distribution of marks: 70 (for final examination) + 30 (Internal Evaluation)
No. of Lectures required (NLP) = 50
Number of Lecture period (NLP) for each group: 25.

Group A: Mathematical Methods of Physics : - I
Marks = 50: No. of Lectures Required (NLP) = 25

Vector Spaces and Matrices: linear independence; Bases; Dimensionality; Inner product;
Linear transformations; Matrices; Inverse; Orthogonal and unitary matrices; Independent
elements of a matrix; Eigenvalues and eigenvectors; Diagonalization; Complete orthonormal
sets of functions.

N.L.P.-05

Tensor Calculus: Cartesian tensors. Symmetric and antisymmetric tensors. Levi Vivitia
tensor density. Pseudo tensors. Dual tensors. Dire4ct product and contraction. Dyads and
dyadics. Covariant, Contravariant and mixed tensors. Christoffel symbols and differentiation
tensors.

N.L.P.-06

Functions of a Complex variable: Complex algebra. Cauchy Reimann conditions. Cauchy’s
integral theorem. Cauchy’s integral formula – its applications. Taylor’s expansion. Analytic
continuation. Laurent’s expansion.

N.L.P.-10

Principal value – its applications.

N.L.P.-04

Group B: Mathematical Methods of Physics : - II
Marks = 50: No. of Lectures Required (NLP) = 25

Group Theory: Introduction. Discrete groups. Continuous groups. Generators. SU(2), SU(3)
and homogeneous Lorentz groups.

N.L.P.-5

order linear ODEs with variable coefficients. Singular points. Series solutions : Frobenius’
method. Second solution.

N.L.P.-6

Nonhomogenous equation. Green’s function. Dirac delta function. Self adjoint differential

N.L.P.-2

Special Functions: Gamma functions. Incomplete Gamma functions. Bessel functions of
Physical applications. Legendre functions. Multipole expansions; special properties.

**Integral Transforms:** Laplace transform; First and second shifting theorems; Inverse LT by partial fractions; LT of derivative and integral of a function; Fourier series; FS of arbitrary period; Half wave expansions; Partial sums; Fourier integral and transforms; FT of delta function.

**TEXT BOOKS:**

3. Spiegel (Schaum’s Outline Series) : Complex Variables

**REFERENCE BOOKS:**

2. R.V. Churchill : Complex variables and applications.
**Classical Mechanics**  
**PH- 0702C (Theory)**  
**Full Marks = 100**  
**Credit=4**  
(Distribution of marks: 70 (for final examination) + 30 (Internal Evaluation))  
**No. of Lectures required (NLP) = 50**

**Group A: Classical Mechanics: - I**  
**Marks = 50: No. of Lectures Required (NLP) = 25**

**Preliminaries:** Newtonian mechanics of single and many particle systems, conservation laws, work-energy theorem, motion of a system with variable mass.  

**Constraints:** their classification, forces of constraints, generalized coordinates and generalized momentum, principle of virtual work, D’Alembert’s principle, generalized force, Lagrange’s equations for a conservative and non-conservative systems, applications of Lagrange’s formulation to simple cases, motion of a charged particle in electromagnetic field, dissipative systems; Rayleigh dissipation function.

**Rotating frames:** Use of Lagrange’s equation and expressions for inertial forces, operator relations between fixed and rotating frames of references, motion of a particle in rotating frame and calculations of pseudo forces, terrestrial and astronomical applications of Coriolis force, effect of centrifugal force on the acceleration due to gravity.

**Rigid body motion:** kinetic energy, moment of inertia tensor, angular momentum, Euler angles, motion of heavy symmetric top, Euler equations, stability conditions.

**Hamilton’s principle:** techniques of the calculus of variations, Derivation of Lagrange’s equations from Hamilton’s principle, Extension of Lagrange’s equations to non-holonomic systems, Lagrange multipliers and applications, conservation theorems and symmetry properties.

**Group B: Classical Mechanics: - II**  
**Marks = 50: No. of Lectures Required (NLP) = 25**

**Small oscillations:** formulation of the problem, the eigenvalue equation, eigenvectors and their orthogonality, the principal axis transformation, frequencies of free vibrations, normal modes and normal coordinates, free vibrations of a two coupled parallel simple pendulums system, free vibration of a linear triatomic molecule.

**Hamiltonian formulation:** Legendre transformations and the canonical equations, Hamilton’s canonical equations, advantage of Hamilton’s formulation, symmetries and conservation laws in Hamiltonian picture, derivation of Hamilton’s equations from variational principles. Principle of least action.

**Canonical transformations:** The equations of canonical transformation, infinitesimal canonical transformation, Poisson’s brackets and other canonical invariants, angular momentum Poisson’s bracket relations.

**Hamilton-Jacobi theory:** The Hamilton-Jacobi equation for Hamilton’s principal function, Hamilton-Jacobi equation for Hamilton’s characteristic function; action-angle variables.
Lagrangian and Hamiltonian formulation of continuous system: the transition from discrete to continuous system, the Lagrangian formulation for continuous system, the Hamiltonian formulation for continuous system, the stress energy tensor and conservation theorems, Noether’s theorem.

Text Books:
DIGITAL CIRCUIT DESIGN

Phase 1:
1. Construct a power supply of ± 12 V / ± 15 Volts using regulator ICs. Make a facility of using = +5V in the same bread board.
2. Design and implement the following LOGIC GATES using discrete components like resistance, capacitor, diodes and transistors etc.
   (a) NAND (b) NOR (c) XOR (d) XNOR

Phase 2: Experiment using IC 74**

1. Implement two input OR gate using AND & NOT gates and verify the truth table.
2. Implement two input AND gate using OR & NOT gates and verify the truth table.
3. With basic gates implement two forms of XOR function and verify the truth table.
4. With basic gates implement two forms of XNOR function and verify the truth table.
5. With NAND gates only, implement two forms of XOR functions and verify the truth table.
6. With NOR gates only, implement two forms of XOR functions and verify the truth table.
7. With NAND gates only, implement two forms of XNOR functions and verify the truth table.
8. With NOR gates only, implement two forms of XNOR functions and verify the truth table.
9. Verify the Boolean expressions with truth table
   (a) \((A+B).(B+C).(C+A) = AB + CD + CA\)
   (b) \(A\overline{B} + \overline{A}.B = (A + B).A\overline{B}\)
   (c) \((A+B).(A+C) = A + BC\)

Phase 3: Experiments with Linear ICs

1. To construct and study HALF ADDER circuit using AND gate and XOR.
2. To construct and study HALF ADDER circuit using OR, AND and NOT gates.
3. To construct and study a HALF SUBTRACTOR using AND, NOT and XOR gates.
4. To construct and study a HALF SUBTRACTOR using OR, AND and NOT gates.
5. To construct a FULL ADDER using OR, AND and XOR gates.
6. To construct a FULL SUBTRACTOR using OR, AND and XOR gates.
7. To study the 4-bit PARALLEL ADDER using FULL ADDER IC.
8. To study a 4-bit SUBTRACTOR using FULL ADDER IC.
9. To study 4-bit SUBTRACTOR/ADDER using mode control.

ANALOG DESIGN

Phase 1: Using Transistor

1. Design of common emitter amplifier and study of its bandwidth.
2. Design of an emitter follower and study of its bandwidth.
Phase 2: Using Linear IC 741/536 (OPAMP):

1. Design non-inverting amplifier with gain at any desired value in between 10 to 20 and
   (i) Study the frequency response curve with input voltages fixed at 200 mV, 500 mV and 1V.
   (ii) Keep the frequency fixed at 100 Hz, 1 KHz and 10 KHz and study the variation of output voltage with input.
   (iii) Study the gain-bandwidth product considering gains equal to 1, 10 and 20.
2. Design inverting amplifier with gain at any desired value in between 10 to 20 and
   (i) Study the frequency response curve with input voltages fixed at 200mV, 500 mV and 1V.
   (ii) Keep the frequency fixed at 100 Hz, 1 KHz and 10 KHz and study the variation of output voltage with input.
   (iii) Study the gain-bandwidth product considering gains equal to 1, 10 and 20.

Phase 3: Using Linear IC 741/536 (OPAMP):

1. With designing details, construct and study the following first order active filters
   (i) Low-Pass (ii) High-Pass (iii) Band-Pass (iv) Band-Reject
2. With designing details, construct and study the following first order active filters
   (i) Low-Pass (ii) High-Pass (iii) Band-Pass (iv) Band-Reject
3. Design and construction positive and negative half wave rectifiers and study their distortion with respect to variation of input voltage and frequency.
4. Design and construction positive and negative full wave rectifiers and study their distortion with respect to variation of input voltage and frequency.

PHS 0703C Group: B (Credit=2)

Computer Programming and Numerical Analysis: (Practical)

Total number of lectures required: 10 (theory)

Numerical Analysis: Theory: Solution of nonlinear equations; functional iteration; bisection method; secant method; Newton - Raphson method. Interpolation: Linear interpolation; Newton’e method; Lagrange’s interpolation; numerical differentiation, Numerical integration, Riemann, trapezoidal and Simpson’s rules; Romberg integration; Gaussian quadrature formula. Solution of linear simultaneous equations - Gauss elimination; Gauss - Jordan elimination. Matrix algebra; eigen values and eigenfunctions of matrices. Elementary statistical estimations; frequency distribution; simple regression; linear least square fitting; correlation coefficient. Solutions of ordinary differential equations (ODE); solution of ODE as an initial value problem; Euler’s method; Runge Kutta method; predictor corrector method.

Total number of lectures required: 10 (theory)
ST 704 E  Basic Statistics  Credit 4

(From other Department preferably from Statistics)

CSK-II Computer Skill-II :  Credit = 4

(To be done in Computer Science/IT Department)

Basic Quantum Mechanics
PH-0801C

Full Marks = 100       Credit = 4
(Distribution of marks: 70 (Final examination) + 30 (Internal Evaluation)

Group A
Marks = 50: No. of Lectures Required (NLP) = 25

NLP=3

Hilbert space formalism for quantum mechanics, States as vectors and dynamical variables as linear operators on vector space, Dirac notation. Linear operators, Hermitian operator, Projection operators, Unitary operators, Eigenvalues and eigen vectors of an operator. Matrix representation of Kets, Bras, Operators and Eigen value problem, Complete set of Commuting observables, Degeneracy. Commuting observable. Compatibility and Uncertainty relations between two operators.

NLP=7

NLP=10

Creation and Annihilation operator, Number operator. Application of operator method to solve the eigenvalue problem of linear harmonic oscillator.

NLP=5

Group B:
Marks = 50: No. of Lectures Required (NLP) = 25

NLP=10

NLP=8

NLP=7

Books:
A.K. Ghatak and S. Lokannathan – Quantum Mechanics
Schiff, L. S., Quantum Mechanics, (Tata McGraw-Hill Education).
Cohen-Tannoudji, Quantum Mechanics - Vol 1
Group A: Statistical Mechanics: - I
Marks = 50: No. of Lectures Required (NLP) = 25

Foundations of statistical mechanics; Objective of statistical mechanics, macrostates, microstates, ensembles and phase space, connection between statistics and thermodynamics, postulate of equal a priori probability, ensemble average, density distribution in phase space, counting the number of microstates in phase space.

NPL=3

Thermodynamic probability, general expression for probability of a distribution and the most probable distribution, Liouville’s theorem in classical statistical mechanics, density of states and counting of number of states.

NPL=3

Microcanonical ensemble, application to ideal gas, Canonical ensemble: System in contact with a heat reservoir, canonical partition function, thermodynamics in canonical ensemble, classical ideal gas, mean values of energy and pressure, fluctuation in internal energy, entropy of classical ideal gas, entropy and probability, Helmholtz free energy, entropy of mixing and Gibbs' paradox, equipartition theorem, system of harmonic oscillators, statistics of paramagnetism.

NPL=8

Grand Canonical Ensemble: equilibrium between a system and a particle-energy reservoir, grand canonical partition function, application to ideal gas, density and energy fluctuation, calculation of entropy.

NPL=4

Formulation of Quantum Statistics: Identical particles and symmetry requirements, many-particle wave functions, macroscopic and microscopic states for quantum systems.

NPL=2

Density Matrix: Quantum Liouville’s theorem, Density matrices for microcanonical, canonical and grand canonical systems, simple examples of density matrices: one electron in a magnetic field, particle in a box.

NPL=5

Group B: Statistical Mechanics-II
Marks = 50: No. of Lectures Required (NLP) = 25

NPL=10

Cluster expansion for a classical non-ideal gas, fluctuations and transport phenomena, Brownian motion and Langevin theory, motion under fluctuating force: The Fokker-Planck equation.

NPL=5
Virial equation of state, Ising model: partition function for one dimensional case, solution of Ising model in one dimension by transfer matrix method, Brag-William approximation.

Phase transition: first and second order, Landau theory of phase transition, critical exponents and scaling relations, scale transformation and dimensional analysis.

Text Books:
1. F. Mandl, Statistical Physics.
2. F. Reif: Statistical and Thermal Physics
3. K. Huang: Statistical Mechanics
4. R. K. Pathria: Statistical Mechanics
5. L. Kadanoff, Statistical Mechanics.
Group A: Electronics: - I (Number of lecture period: 25)

Bipolar devices: Carrier concentration in intrinsic semiconductor, Fermi level in intrinsic and extrinsic semiconductor, basic semiconductor equations, volt-ampere equation in pn diode, temperature dependence of VI characteristics of pn diode, dynamic diffusion capacitance. *(Integrated Electronics: J. Millman and C Halkias)*

Field-effect transistor: Ideal voltage controlled current source, JFET, MESFET, MOSFET (both enhancement and depletion type), structure, volt-ampere characteristics, the DC analysis of FET, the MOSFET as a resistance, the FET as a switch, the FET as an amplifier, small signal FET model. *(Microelectronics : Millman abd Crabel)*

Microwave device: Conception of negative resistance and its significance, the Tunnel diode, Gunn diode, p-i-n diode, Avalanche photo-diode, IMPATT, TRAPATT, BARITT diodes *(Microwave Devices and circuits: S.Y. Liao)*

Memory device: Definitions and characteristics of ROM, EROM, EPROM, RAM, SRAM & DRAM; NMOS inverter, propagation delay in NOMOS inverter, the NMOS logic gates, the CMOS inverter, the CMOS logic gates, CCD, introduction to magnetic, optical and ferroelectric memories. *(Microelectronics : Millman abd Grabel)*

Operational Amplifiers (OPAMP) applications: Butterworth active filters of first and second order, RC phase shift oscillator, multivibrators (mon-stable and astable), logarithmic and antilogarithmic amplifiers, comparator, Schmitt trigger, triangular and square wave generators, high input impedance voltmeter. *(Operational amplifier: Robert F. Coughlin and Fredrick F. Driscoll)*

Group B: Electronics: - II (Number of lecture period: 25)

Analog circuits: Bipolar transistor bias stabilization against variation of temperature, IC, VBE and emitter follower, hybrid-p common emitter transistor model and short circuit current gain. *(Integrated Electronics: J. Millman and C Halkias)*

Feedback amplifiers: Classification of amplifiers, the feedback concept, the transfer gain with feedback, input and output resistances in the case of voltage-series-, current-series-, voltage shunt-, and current shunt negative feedback, bandwidth expansion and reduction of noise by negative feedback. *(Integrated Electronics: J. Millman and C Halkias)*
**Power circuits and system**: Large signal amplifiers, harmonic distortion, Class A, -B and –AB operation, efficiency of class A amplifier, Class A and –B Push pull amplifiers. *(Integrated Electronics: J. Millman and C Halkias)*

**Power supply**: Input regulation factor, output resistance, temperature coefficient; series voltage regulator preliminary and use of Darlington pair *[Integrated Electronics: J. Millman and C Halkias]*.

**Communication Electronics**: Basic architecture of electronic communication. Amplitude Modulation: Ordinary AM generation demodulation; Generation of DSB signal and demodulation of DSB signal; Generation of SSB signal and demodulation of SSB signal; Generation of VSB signal and demodulation of VSB signal; Frequency translation and mixing, Frequency division multiplexing (FDM). *[Analog and digital communications: H. P. Hsu]*
Advanced Practical – I

Expt-1:  
(a) Determine the reverse saturation current $I_0$ and material constant $n$ of a given pn junction diode.  
(b) Determine the temperature coefficient of Junction voltage and energy band gap for the same.

Expt-2: Determine the resistivity and band gap of semiconductor by four probe method.

Expt-3: For given LED study the following: 
i) Forward voltage vs. forward current characteristics. 
ii) Forward current vs. luminus intensity. 
iii) Angular displacement vs. luminus intensity.

Expt-4: Determine the dielectric constant of the given samples following capacitance measurement technique.

Expt-5: Determine the curie temperature of a given ferroelectric sample using dielectric constant measurement technique.

Expt-6: Study the Hall Effect and determine:  
i) Hall Voltage ii) Hall Coefficient iii) type of majority charge carriers ( i.e. determine whether the semiconductor sample is of the n-type or p-type) iv) mobility of charge carrier.

Expt-7: Using Lattice Dynamics Kit  
i) Study of the dispersion relation for the mono-atomic lattice-Comparison with theory.  
ii) Determination of the cut-off frequency of the mono-atomic lattice.  
iii) Study of the dispersion relation for the di-atomic lattice – ‘acoustical mode’ and ‘optical mode’ energy gap. Comparison with theory.

Expt-8:  
i) Study the I-V characteristics of a given solar cell used as photodiode under light and dark condition.  
ii) Study the fill factor of the given solar cell. 
iii) Study the spectral response curve

Expt-9: For given Photodiode study the following:  
i) I-V characteristics under reverse bias and constant illumination.  
ii) Illumination vs. reverse current characteristics  
iii) Angular displacement vs. luminous intensity under constant reverse voltage.

Expt-10: Demonstration of modulation and demodulation by fiber optics digital communication system
Expt-11: Demonstration of modulation and demodulation by fiber optics analog communication system

Expt-12: Demonstration of amplitude and frequency modulation and demodulation

Expt-13: Determination of dissociation energy of iodine using absorption spectrophotometer

Expt-14:
i) To determine $\lambda_{\text{max}}$ (wavelength of maximum absorption) of a given solution using a spectrophotometer
ii) To verify Beer-Lambert’s law and apply it to find the strength of unknown solution

Advanced Practical – II

Expt-1: Determine the wavelength of the wavelength and the wavelength separation of the sodium D lines using Fabry-Perot Interferometer.

Expt-2: Determine the wavelength of an unknown light using Michelson Interferometer.

Expt-3: Determine the coercivity, retentivity and saturation magnetization by the study of hysteresis curve using hysteresis loop tracer.

Expt-4: Determine the Lande g – factor for a given paramagnetic substance using electron spin resonance spectrometer.

Expt-5: Determine the dead time of a G.M. Counter using double source method.

Expt-6: G. M. Counter – a single source statistical analysis

Expt-7: Determine the resistivity and band gap of a given semiconductor by four probe method.
Paper: PH- 0805E (option 1)
Microprocessor Architecture and Programming
Credit = 4  Full Marks = 100  Credit = 4
(Distribution of marks: 70 (for final examination) + 30 (Internal Evaluation)
No. of Lectures required (NLP) = 50

Theory:

Internal microprocessor architecture, Memory mapping, Data addressing modes, Program
addressing modes, Stack memory addressing modes, Data movement instructions, Arithmetic
and logic instructions, Program control instructions, Assembler details, Modular
programming, using the keyboard, Data conversion, Disc files, Example programs, Pin-out
and the pin functions of 8085 and 8085A, clock generators(8284A), Bus buffering and
latching, Bus timing, Ready and Wait states, Memory devices, Address decoding in 8085A,
memory interface, Dynamic RAM, Introduction to I/O interface, I/O port address decoding,
Direct Memory Access.

Practical:

Programming in 8085 assembler kit
Introduction to various open source and proprietary computational software, software licensing, installation in different operating system environment, familiarization of the different sections of a software package, navigation, help and resources, console commands, basic variables, constants and operators, running codes from console and editors, control statements, matrix operations, functions, handling format and runtime errors, basic 2D and polar plots, polynomial operations, data read and write operations, package installations, image processing, low and high pass filtering of image, addition of noise in an image, image noise reduction, edge detection, face recognition, statistical operations, basic regression analysis, definite integral, solving linear and non-linear equations, advanced plotting, Graphical User Interface (GUI), circuit simulation, symbolic mathematics, application of numerical analysis to problem solving in physics, basic modeling, basic concept of Artificial Intelligence (AI)

Group A: Classical Electrodynamics and Special Relativity : I
Marks = 50: No. of Lectures Required (NLP) = 25

**Electrostatics: Multipole expansion.** Electrostatics with ponderable media. Boundary value problems. With dielectrics, Clausius-Mossoti equation, Model for molecular polarizability, Electrostatic energy for dielectric media.  
NLP=7

**Magnetostatics: Magnetic multipoles. Dipole-Dipole interaction. Fermi contact term.**  
NLP=3

**Maxwell’s equation(recapitulation) :** Vector and Scalar Potential, Gauge Transformation: Lorentz and Coulomb Gauge, Poynting vector and theorem, Complex Poynting Vector. Inhomogeneous wave equation and its solution using Green’s function.  
NLP=6

NLP=5

**Magnetohydrodynamics:** Basic equations, Magnetic pressure and diffusion, Pinch effect, Alfven waves.  
NLP=4

Group B: Classical Electrodynamics and Special Relativity: - II
Marks = 50: No. of Lectures Required (NLP) = 25

NLP=10

**Special Relativity:** Relativistic addition of velocity and acceleration in vectorial form, Doppler effect, Thomas precession, four-momentum and four force.  
NLP=5

NLP=10

No. of Practical classes required = 150 Practical classes

Group A: Advanced practical (Digital) Marks = 50: Practical classes: 75
RS Flip-flop with and without clock pulse (NOR and NAND latch)
Gated SR Latch and edged-triggered SR Flip-flop
The D-latch: gated D-latch & edged-triggered D Flip-flop
T flip flop
JK Flip-flop/JK master-slave Flip-flop
Shift Register (SISO, SIPO, PIPO, PISO)
Ripple counter (up and down)
Parallel counter (up and down)
Decade counter (up and down)

Group B: Advanced practical (Analog) Marks = 50: Practical classes: 75
Positive and negative clipper with and without Op-Amp
Positive and negative clamper with and without Op-Amp
Zero crossing device using Op-amp
Comparator using Op-amp
Schmitt trigger using Op-amp
Triangular wave generator using Op-amp
Differentiator and Integrator using Op-amp
Logarithmic amplifier using Op-amp
Digital-to-Analog converter using Op-amp
Mono-stable and astable multi-vibrator using Op-amp and timer IC

Text Books: As prescribed during the practical classes time to time

Astronomical Co-ordinates: Celestial sphere, Cardinal points and Great circles on the celestial sphere. Horizontal and Equatorial coordinate system, Ecliptic and Galactic system of co-ordinates.

Star formation in Interstellar medium (ISM), Various nebula, Hydrostatic equilibrium, Gravitational collapse, Jeans condition for Gravitational collapse, Jeans mass, Protostars, Stellar structure and Evolution.

Basic information: Degeneracy pressure in White dwarf and Neutron star. Chandrasekhar limit, Pulsars, Supernova, Black holes and types., Gamma ray bursts, Gravitational Waves, Different models of the origin and evolution of the Universe, Microwave Background radiation, Age of the Universe. Dark Matter and Dark Energy

Text Books:
Baidyanath Basu, Astrophysics, Prentical Hall.
W. M. Smart, Text book of Spherical Astronomy.
V. A. Ambartsumyan, Theoretical Astrophysics.
Joseph Silk, The Big Bank: The creation and evolution of the universe.
K R Lang, Astrophysical quantities, Springer Verlag
Melean,Electronic Imaging Astronomy, Wiley.
J. V. Narlikar, Introduction to cosmology, CUP.
Group-A

Definition of nano, Scientific Revolution, Emergence and Challenges of nanoscience and nanotechnology, Influence of nano over micro/macro dimension. Size effect. Large surface to volume ratio, Delocalization of free electrons, Optical effect. Surface effect on the properties. NLP-10

One dimensional, Two dimensional and Three dimensional nanostructured materials, Quantum Dots. Metal oxide nano particles, semiconductor nano particles, composites nano particles, mechanical-physical-chemical properties. NLP-8

Application of nano particles: In electronics and opto electronics devices, in coating and paint technology, biological and environmental technology and drug delivery system, polymer based application. NLP-7

Group-B

What is Thin Film and why it is important, Two dimension nano structure. Different Thin Film preparation techniques, Brief discussion on Langmuir Blodgett technique, layer-by-layer self assembled technique, Spin coating technique, vacuum deposition technique. Different characterization techniques NLP-15

Brief discussions on the application of Thin Film in different technological fields- in preparation of Light emitting diodes, in MOSFET, in Transistor and diodes, in various sensors, in gas sensor, in biological sensors and others. NLP-10

Group A: Condensed Matter Physics: - I
Marks = 50: No. of Lectures Required (NLP) = 25

Crystal Physics: Crystalline solids, unit cells and direct lattice. Two and three dimensional bravais lattices, closed packed structures

Point defects, line defects and planar (stacking) faults. The role of dislocations in plastic deformation and crystal growth. The observation of imperfections in crystals. X – ray and electron microscopic techniques.

Lattice specific heat, Classical and Quantum mechanical approach
NLP 2

Group B: Condensed Matter Physics: - II
Marks = 50: No. of Lectures Required (NLP) = 25

semiconductors and insulators. Tight binding approximation. Band structure in Si, Ge and alloys.

TEXT BOOKS:

REFERENCE BOOKS:

Advanced Electronics  
PH-1002C  
(Credit-4)  
Fourth Semester  

Group A  
Advanced Electronics: Digital  
Analog to Digital Conversion: Sampling theorem (low pas signal and band pass signal), Natural sampling and flat top sampling, Signal recovery through holding, Pulse-Amplitude modulation (PAM), Pulse width Modulation (PWM), Channel BW for PAM signal, Quantization of sampled signal, Quantization error, Pulse code modulation (PCM), Differential pulse code modulation (DPCM), Delta modulation (DM), Adaptive delta modulation (ADM), CVSD, Line code and spectral shaping [Principles of communication systems: H. Taub and D. L. Schilling].

Noise in Pulse-Code and Delta-Modulation systems: PCM transmission, calculation of quantization noise, the output signal-power in PCM, the effect of thermal noise, the output signal-to-noise ratio in PCM, Delta modulation (DM), quantization noise in DM, the output signal power in DM, the DM output-signal-to-quantization-noise ratio, the effect of thermal noise in Delta modulation, output signal-to-noise ratio in DM. [Principles of communication systems: H. Taub and D. L. Schilling].

Mobile Radio and Satellite: Time Division Multiple Access (TDMA), Frequency Division Multiple Access (FDMA), ALOHA, Slotted ALOHA, Carrier Sense Multiple Access (CSMA), Poison distribution, protocol, Mobile network system, Cell structures, hand-off procedure and frequency reverse scheme, GSM system.
**Group-B**

**Advanced Electronics: Analog**

**Sweep Generators:** General features of time-base signal, Methods of generating time-base waveform----exponential sweep circuit, negative resistance switches, Miller and bootstrap time-base generators. [Pulse, Digital and Switching waveforms: J. Millman H. Taub]

NLP = 5

**Silicon Controlled Rectifier (SCR):** The four layer diode, pnnp characteristics, V-I characteristics of three terminal SCR, SCR control circuit [pulse control, power control, over voltage protection circuit], the triac and diac.] (Integrated Electronics: J. Millman and C Halkins).

NLP= 5

**Radio wave propagation and satellite communication:** Ground (surface) waves, surface wave propagation-The ionosphere, space waves, tropospheric scatter propagation, extraterrestrial communications, fundamentals of satellite communication, Global Navigational Satellite Systems (GNNS), Global positioning system (GPS) [Electronic Communication Systems: Kennedy and Davis; Data communications and Networking: B. A. Forouzan]

NLP = 5

**Television:** Television system and standard, Scanning, blanking and synchronizing pulses, Television camera (B & W picture and colour picture), Tonal and Colour characteristics of pictures, Composite B 7 W and colour video signals, block diagram of colour TV transmitter and receiver.[Electronic communication systems: G. Kennedy].

NLP = 7

**Waveguides:** Reflection of waves from conducting plane, the rectangular waveguide TM and TE waves), Cylindrical waveguides (the TEM waves in coaxial line), attenuation in duides due to imperfect conductors. [Networks, lines and fields: J. D. Ryder]

NLP = 6

**Fiber optic communication:** fundamentals of fiber optics, different optical fiber cables: fiber characteristics and classification, fiber optic components and systems: the source, noise, response time, optical link [Electronic Communication Systems: Kennedy and Davis]

NLP = 6

**Optoelectronics:** Liquid crystal display dynamic scattering LCD, field effect LCD electrical characteristics of liquid crystal and numeric displays, PhotoFET, optoelectronic coupler consisting of LED and photo transistor. [Electronic Devices and Circuits: D. A. Bell].

NLP = 6
Nuclear Physics & Particle Physics
PH-1003C (Credit-4)

Full Marks = 100
(Distribution of marks: 70 (for final examination) + 30 (Internal Evaluation)
No. of Lectures required (NLP) = 50

Group A:
Marks = 50: No. of Lectures Required (NLP) = 25

Nuclear reactions, Q-value, Direct and Compound nuclear mechanisms, Cross-section in terms of partial wave amplitude.

Group B:
Marks = 50: No. of Lectures Required (NLP) = 25

Nuclear decay: Gamow’s theory of alpha decay; Beta decay- Neutrino hypothesis, Helicity, Fermi’s theory of beta decay, Coulomb correction, Curie Plot, electron capture, total decay rates, Comparative half-lives, Allowed and Forbidden transitions, Selection rules for Fermi and Gamow-Teller transitions, Parity violation in beta decay, Wu’s Experiment. Gamma decay, multiple transitions in nuclei, Angular momentum and Parity selection rules, Internal conversion, Nuclear isomerism.

Books:
D. C. Tayal, Nuclear Physics, (Pragati Prakashan, 2008).
S N Ghoshal, Nuclear Physics (S. Chand, 2004)
W.S.C. Williams: Nuclear and Particle Physics
I. S. Hughes: Elementary particles
B. L. Cohen: Concepts of Nuclear Physics
J. M. Blatt and V. F. Weisskopf: Theoretical Nuclear Physics
Ashoke Das: Introduction to Nuclear Physics
Project Work
PAPER – PH-1004C (Project)

Credit = 6  Full Marks = 100

Part-1 (Credit-2)
Visit to different laboratories, institutions, industry sectors etc and submission of report.

Part-2 (Credit-4)
Work to be carried out as per the instruction of supervisor, dissertation preparation, presentation and interaction
Advanced Physics

PH-1005E (Credit=4)

Group: A
(Atmospheric Science and Solar Environment Physics)
Total marks: 25, Total lecture periods: 12

**Atmospheric science**
*total marks= 12.5, total lecture periods: 06*
Origin and composition of the Earth’s atmosphere, distribution of pressure and density, ionosphere, atmospheric electric field, magnetosphere, distribution of temperature and winds, atmosphere as a fluid and physical laws, overview of meteorological observations, surface, radar, upper-air and satellite observational techniques, introduction to Chaos dynamics

**Solar environment**
*total marks= 12.5, total lecture periods: 06*
Structure and composition, solar rotation, the quiet Sun, sunspots, radiation characteristics, 11 year periodicity, solar flares, coronal mass ejection, prominences, calcium plages, monitoring the sun with radio emission and X-rays, solar wind, solar proton event, solar magnetic field and its variation and solar noise storms.

Group-B
(Thin Film and nano Science Group)
Total marks: 25, Total lecture periods: 13

UV-Vis absorption spectroscopy, Fluorescence spectroscopy, in-situ Brewster angle microscopy (BAM), Atomic force microscopy (AFM), Scanning electron microscopy (SEM), Fluorescence resonance energy transfer (FRET), Bio-mimetic surface.

Group-C
(Nanophysics and Nanotechnology)
Total marks: 25, Total lecture periods: 12

Group-D
(Introductory Theoretical Chemical Physics)
Total marks: 25, Total lecture periods: 13
Elementary idea about the approximation methods in molecular quantum mechanics: Thomas Fermi model, Hartree theory, Hartree-Fock (HF) Approximation, Roothaan equations, Configuration Interaction, Coupled-Cluster Theory. Density functional theory : Introduction to density functional theory, early density functional theories, the H-K theorems, the Kohn-Sham approach, K-S equation, exchange-correlation functionals, Generalized Gradient approximation (GGA), Local density Approximation (LDA), Local Spin Density Approximation (LSDA), concept of LCAO and basis set, applications and limitations of DFT. Computational algorithms and Packages related to DFT.
